The Vacant-Pad Fill Calculator

Property: _____ **Date:** _____

Work the math on paper before you believe the upside story. Buyer forums report actual fill costs landing at roughly 300% of initial estimates.

1. Per-pad cost build

Cost item	Typical	Your cost
Home transport	~$5,000	
Disconnect at old site	~$5,000	
Reconnect and hookup	~$5,000	
Permits and inspections		
Skirting and steps		
Pad repair		
TOTAL per pad		

2. The overrun stress test

Stress-test total = per-pad total x number of pads x 3. If the stressed number breaks your down payment, your fill plan is a fantasy.

3. Stabilized upside

Monthly lot rent: _____

Pads you plan to fill: _____

Annual upside (lot rent x 12 x pads): _____

Years to pay back (stressed total / annual upside): _____

4. Count check

- [ ] Count occupied pads, vacant pads, AND abandoned/derelict units separately.
- [ ] Derelict units cost money to remove before you can fill the pad.

The question this answers: can this park's vacant pads actually pay for themselves, or are they a liability dressed as upside?
