RV Revenue Reality Check

Park: _____ **Date:** _____

Part D: Prove the numbers.

Takes in: AS-15R's verified months.

Hands to: AS-08R, AS-19.

An RV park sells nights, not leases. The broker shows you July. You underwrite the whole year.

Built for RV park economics. MHC lot-rent math runs different.

1. The mix: where the revenue actually comes from

Segment	Nights / year	Avg rate ($)	Revenue ($)
Nightly			
Weekly			
Monthly			
Seasonal			
TOTAL			

Fill from the reservation export, not the brochure.

Average daily rate (ADR) = revenue divided by nights sold. Occupancy = nights sold divided by nights available.

2. Occupancy and ADR by month: fill from the reservation export

Month	Occupancy %	ADR ($)	Month	Occupancy %	ADR ($)
Jan			Jul		
Feb			Aug		
Mar			Sep		
Apr			Oct		
May			Nov		
Jun			Dec

3. Pull these before you believe any revenue number

- [ ] Reservation software export: every stay for the last 24 months, not a summary report. Ask the seller to run it while you watch.
- [ ] Sales channel split: direct, online travel sites, drive-up. Channel fees come off the top.
- [ ] Lodging and transient occupancy tax filings: the revenue number they reported to the county.
- [ ] Monthly bank deposits, all 12: the reservation story must match the money story.

Lodging tax is paid by the guest but remitted by you. Confirm who owes it and whether it is current. Lodging and long-stay tax rules vary by state and county: confirm with your attorney.

4. Strip the peak-season story down to a stabilized number

Stabilized revenue = the sum of each month's actual revenue. Not July times 12.

- Weight by the real mix. If 60% of revenue lands in 4 months, write that down and underwrite it.
- Advance deposits for next season are next season's money. Back them out.

Stabilized annual revenue ($): _____ **Peak month revenue x 12 ($):** _____

If those two numbers are close, the park has no season. If they are far apart, the brochure used the second one.

Worked example

Fictional running case: Pine Hollow RV Park. Every number below is checked against the seeds; the arithmetic is shown so you can check it too.

Step	Math	Result
Seller claimed revenue	129,600 + 291,708	$421,308
Bank deposits, 12 months		$352,000
Raw gap	421,308 - 352,000	$69,308 (16.4%)
Gap bridge: shortfall items $25,300, deposit inflators $19,000 (full bridge in AS-15R)	421,308 - 25,300 + 19,000	Expected $415,008; unexplained $63,008 (15.0%)
Pause threshold (3% of claimed)	421,308 x 0.03	$12,639
Verdict	63,008 > 12,639	PAUSE. Explain in documents, not words.
Proven transient revenue	352,000 - 129,600 - 11,200 - 7,800 - 2,500 + 9,600 = 210,500	$210,500
Realized ADR	210,500 / 6,077	$34.64 (rack was $48)
Revenue per available site-night	210,500 / 13,505	$15.59
July outside check	94% claimed vs flat meter	Claim fails.

The broker's story was July. The year's money proves $210,500 of transient revenue: $34.64 realized against the $48 rack, $15.59 per available site-night. The meter says July was not 94%. The full Gap Bridge lives in AS-15R. Pause until the seller explains it in documents.

The Doctrine

The belief this tool shatters is that a strong peak season means a strong park. July is a story. The whole year is the revenue. The one rule: underwrite the stabilized number, the sum of all twelve real months, never July times twelve. The seller shows you the best month because the best month is for sale and the other eleven come free. Collected lodging and sales taxes and advance deposits inflate your deposits, so strip them. Platform fees do the opposite: payouts arrive net of fees, so add them back before you call revenue proven. Then check the power meter, which cannot be edited. If the occupancy claim moves and the meter does not, the claim is fiction. A park that only works in July is a seasonal business priced like a year-round one. Price the business you are buying, not the brochure you were shown.
