The Transient-Site Fill Calculator

Property: _____ **Date:** _____

Part D: Prove the numbers.

Takes in: transient site count and seasonality.

Hands to: AS-08R (fill costs land in expenses), AS-07 (structure the offer).

Empty sites are not upside until you price the build, the permits, and the empty months.

Built for RV transient-site math. For MHC lot fill, use its sibling: Vacant-Pad Fill Calculator (AS-10).

1. Per-site fill cost build

Cost item	Your number
Pad prep and grading	
Electrical pedestal and hookup	
Water and sewer hookup	
Permits and inspections	
TOTAL per site	

Require two local contractor quotes before you underwrite any number above.

2. The overrun stress test

Scenario	Multiplier	Sites	Scenario total ($)
Plan	1.0		
Likely			
Bad			

Stressed total = per-site total x sites x multiplier. The multiplier is a prudence heuristic, not field data.

3. Stabilized upside

Realized ADR = transient site revenue / transient site-nights sold, after discounts and comp nights. Underwrite realized, not rack rate.

Stabilized annual revenue = realized ADR x (sites x 365 x occupancy) minus annual site expenses.

Realized ADR ($): _____ **Sites to fill:** _____ **Stabilized occupancy (%):** _____

Annual site expenses ($): _____ **Stabilized net annual ($):** _____ **Months to stabilize:** _____

4. Lease-up curve

Month 1 target: _____ **Month 2 target:** _____ **Month 3 target:** _____

Month 4 target: _____ **Month 5 target:** _____ **Month 6 target:** _____

5. Fund it from where

☐ If fill stalls at 50 percent, the debt still gets paid from verified current income.

Monthly debt service at 50 percent fill ($): _____ **Months of reserve behind it:** _____

The upside credit rule: the seller gets zero credit for unrealized upside. You pay for what exists on closing day.

This resource is an organizational tool, not professional advice. Investment, legal, engineering, title, environmental, insurance, tax, and lending decisions belong with qualified professionals.

Worked example: Pine Hollow, four transient sites

Fictional example. Seeds from the Pine Hollow running case. Realized ADR from the ledger: 210,500 / 6,077 = $34.64. Underwrite realized, not the $48 rack.

Fill cost per site

Cost item	Your number
Pad prep and grading	$1,500
Electrical pedestal and hookup	$2,800
Water and sewer hookup	$3,200
Permits and inspections	$900
TOTAL per site	$8,400

Per-site total = 1,500 + 2,800 + 3,200 + 900 = $8,400.

Three scenarios, four sites

Scenario	Multiplier	4 sites ($)
Plan	1.0	$33,600
Likely	1.25	$42,000
Bad	1.6	$53,760

Scenario total = 8,400 x 4 x multiplier (example: 8,400 x 4 x 1.25 = $42,000).

Stabilized upside, net not gross

Site-nights = 4 x 365 x 0.60 = 876. Revenue = 876 x 34.64 = $30,345. Annual site expenses $3,600. Net = 30,345 - 3,600 = $26,745.

Yield on cost (likely scenario) = 26,745 / 42,000 = 63.7%. Payback on NET income = 42,000 / 26,745 = 1.6 years. On gross income it would look like 1.4 years (42,000 / 30,345). Payback on net, not gross.

Bad scenario payback = 53,760 / 26,745 = 2.0 years. The 60% occupancy is a stabilized assumption, not a claim. The seller gets zero credit for it until the sites exist.

Doctrine

Doctrine: an empty site is a cost until it is a filled site. The belief this shatters: that empty sites are upside you are lucky to get cheap. They are not. Every empty site carries a bill to build, a bill to permit, and empty months while you market it. The one rule: the seller gets zero credit for unrealized upside. You pay for what exists on closing day, and the upside belongs to whoever funds the build and survives the empty months. Underwrite the cost, the curve, and the bad scenario before you price a single empty pad into an offer.
